

IN THE CLAIMS

Please amend the claims as follows:

1. (Original) A method of wireless communications between a first network and a second network enabling a mobile station (MS) subscribed in the first network to communicate using the second network, comprising:
storing an identity of the mobile station;
obtaining authentication information from the first network based on the identity of the mobile station;
storing the authentication information from the first network in a general global gateway (GGG);
using an algorithm using the authentication information to produce an encryption key; and
using the encryption key to authenticate the mobile station.
2. (Previously Presented) A method of wireless communications between a first network and a second network enabling a mobile station (MS) subscribed in the first network to communicate using the second network, comprising:
storing an identity of the mobile station;
obtaining authentication information from the first network based on the identity of the mobile station;
using the authentication information from the first network to create a key; and
substituting the key for an authentication key used in an algorithm to authenticate the mobile station.
3. (Previously Presented) The method of claim 2, wherein the created key is from the first network.
4. (Previously Presented) The method of claim 2, wherein the algorithm is executed in the second network.
5. (Currently Amended) The method of claim 2, wherein the authentication key is SSD-A (Shared Secret Data -A).

Attorney Docket No. 030259U3

6. (Currently Amended) The method of claim 3, wherein the first network is a GSM (Global System for Mobile Communications) network.
7. (Currently Amended) The method of claim 3, wherein the second network is a CDMA (Code Division Multiple Access) network.
8. (Currently Amended) The method of claim 3, wherein the algorithm is a CAVE (Cellular Authentication and Voice Encryption) algorithm.
9. (Cancelled)
